1. Introduction

In this article, I venture to offer an in-depth analysis of the structure of Old Nubian relative clauses (henceforth, RCs), in an attempt to reorganize and consolidate the observations made in Gerald M. Browne’s *Old Nubian Grammar*,¹ Helmut Satzinger’s earlier article “Relativsatz und Thematisierung im Altnubischen,”² and Marianne Bechhaus-Gerst’s *The (Hi)story of Nobii*.³ Satzinger’s article, our first extensive source for the grammatical analysis of Old Nubian RCs, was written in response to a series of grammatical observations by Browne in *Studies in Old Nubian*.⁴ However, this response was unfortunately never fully incorporated into *Old Nubian Grammar*,⁵ where Browne discusses RCs in §§4.4–6.⁶ In these few dense and somewhat confusing paragraphs, Browne organizes Old Nubian RCs mainly based on word order, without clearly marking out syntactical relations, thus losing much of the insights of Satzinger’s more structured approach. Bechhaus-Gerst offers the most recent analysis of Old Nubian RC constructions in *The (Hi)story of Nobii*, in an attempt to integrate the approaches of Satzinger and Browne, but remarks that “a thorough analysis […] would go beyond the scope,” of her study.⁷ During the preparation of this article we have also consulted comparative material from related contemporary Nile

---

¹ Browne, Old Nubian Grammar.
² Satzinger, “Relativsatz und Thematisierung im Altnubischen.”
³ Bechhaus-Gerst, *The (Hi)story of Nobii*, esp. pp. 207–11. Glossing has been occasionally adjusted to match the set of abbreviations listed in fn. 16.
⁴ Browne refers to Satzinger’s approach as a "somewhat different orientation" (Browne, Old Nubian Grammar, p. 83, fn. 99).
⁵ Browne further combines relative constructions with temporal and adverbial subordinate clauses in *Old Nubian Grammar*, §4.7, which I will not consider here. However, I touch upon conditional and final clauses in "A Note on the Old Nubian Morpheme -א in Nominal and Verbal Predicates." See also Bechhaus-Gerst, *The (Hi)story of Nobii*, pp. 105–10.
⁶ Bechhaus-Gerst, ibid., p. 207.
Van Gerven Oei

Nubian languages: the dissertation of Isameddin Awad on subordination in Nobiin [fia], an article by Abdel-Hafiz Sokarno for Kenzi/Kunuz Nubian data [xnz], and recent work by Angelika Jakobi and El-Shafie El-Guzuuli on rc's in Dongolawi/Andaandi [dgl].

The present paper, glossing and methodically expanding the analyses of the examples adduced by Browne and Satzinger, aims to consolidate the sometimes divergent interpretations offered by Satzinger, Browne, and Bechhaus-Gerst, in an attempt to integrate Old Nubian rc's in a general syntactic framework and to harmonize their analyses with insights from contemporary syntactic theory and comparative material from closely related Nubian languages. This will hopefully allow us to make finer distinctions between the different types of Old Nubian rc's and discuss several pertinent overarching themes, such as leftward movement and extraposition, which owing to relatively marginal penetration of contemporary syntactic theory in Old Nubian studies have so far received little attention.

2. Brief overview

We will start with an overview of attributive rc's in §3, divided between coreferential (the subject of the rc is coreferential with the antecedent of the rc) in §3.1 and non-coreferential (the subject of the rc is not coreferential with the antecedent of the rc) in §3.2. Non-coreferential rc's are further subdivided into those with overt subjects (§3.2.1) and those without overt subjects (§3.2.2). As we will see, the presence or absence of an overt subject influences the morphology of the verb in the rc. For both coreferential and non-coreferential rc's I will also discuss exceptions to the general pattern in which rc's are seemingly postnominal. Section 3.1.1 treats coreferential rc's that have moved leftward and only allow for a restrictive reading. In §3.3.1 we will treat several exceptions with non-coreferential rc's that seem to be generated prenominally, and rc's of time, place, and manner (§3.3.2). Finally, §3.4 deals with constructions in which non-coreferential rc's show an anaphor coindexed with the antecedent. Free rc's, those without an overt antecedent, are treated in §4 according to their grammatical function in the main clause, starting with subject clauses (§4.1) and object clauses (§4.2), which also include different types of complement clauses (§4.2.1–2). Section 4.3 deals with free rc's in other, secondary positions. A specific section (§5) is devoted to rc's in combination with the so-called pred-
icative suffix -ⲏ, including nominal predicates (§5.1), complex verbal predicates, also called periphrastic constructions (§5.2), rcs in vocative or appellative contexts (§5.3), and adjunctive/appositional clauses, which usually feature only a bare -ⲏ suffix without any additional tense morphology (§5.4). Sections 5.5–7 deal with a series of more complex syntactical constructions, including the topicalization through -ⲧⲯⲥ of the antecedent of an RC (§5.5), rcs in the scope of quantifiers (§5.6), and finally quantifier raising through -ⲧⲯⲥ (§5.7). Section 6 treats with two different types of extraposition, in which (part of) the RC appears to have moved to the right of the clause, motivated by the heaviness of the RC. We have distinguished two types of extraposition, depending on whether the non-coreferential RC shows verbal agreement (§6.1) or not (§6.2). Finally, §7 deals with preterite tense morphology in rcs, which appears to be distributed according to whether the RC is coreferential or not. An concluding overview is given schematically in §8.

3. Attributive relative clauses

Attributive RCs are full clauses showing tense morphology, and may feature an overt subject and be introduced by a relative pronoun. An RC is embedded with the main clause, connected through an antecedent that has a syntactical function both in the embedded and in the main clause. If the subject of the RC coincides with its antecedent, we speak of a coreferential attributive RC. If this is not the case, the attributive RC is called non-coreferential. The distinction between coreferential and non-coreferential attributive RCs in Old Nubian is reflected in the syntax, whence Satzinger labels coreferential attributive RCs as “Type A,” and non-coreferential ones as “Type B.” Bechhaus-Gerst broadly follows Satzinger’s categorization, whereas Browne makes no descriptive distinction between the two types, lumping both under the heading “adjectival conversion.”

Old Nubian is an sov language, like Japanese, Turkish, Dutch, or the other Nile Nubian languages. This generalization allows us to make several predictions about its general syntactic structure. First we expect all phrasal heads to align on the right side. This seems to be generally the case when we inspect verb inflection, which consistently appears on the right edge, and nominal inflection (case and determiner). Also note the fact that Old Nubian has postpositions instead of prepositions. This generalization implies that any syntactical construction that on the surface does not follow this general principle will be suspected of movement. Within Nubian languages, whose NP structure is generally very stable and predictable, the
neutral or default position for attributive rcs, whether coreferential or non-coreferential, seems to be postnominal. As we will see below, the majority of Old Nubian examples in the extant literature shows this order, which is corroborated by contemporary Nile Nubian languages.\textsuperscript{15}

1a man [\textit{rel} buru ir-iin doll-\textit{ee}] ii
dem.dist girl 2sg-gen love-comp1 nom
tan-jutti-li
3sg.poss-niece-cop2.prs.3sg\textsuperscript{16}
“The girl whom you love is his niece”

1b tod [\textit{rel} een-gi jom-e-l] nog-s-u
boy woman-acc hit-pst-comp go-pst-3sg
“The boy that hit the woman left”

1c ogij [\textit{rel} in kaa=r aag-il]
man dem.prox house=loc live-ptcp.ipfv
am-beena-n
1pl.poss-uncle-cop.3sg
“The man who lives in this house is my uncle” / “The man living in this house is my uncle”

Ex. 1a shows a non-coreferential attributive rc in Nobiin. The antecedent \textit{man buru} does not correspond to the subject of the rc, which is the genitive-marked subject \textit{iriin}.\textsuperscript{17} The entire subject is, as would be expected in an sov language, marked at its left edge by first the complementizer \textit{-ee} and then the nominative case marker \textit{ii}. Ex. 1b

\textsuperscript{17} (Nearly) all subjects in non-coreferential relative clauses in Nile Nubian are marked with the genitive case, see §3.2.
Old Nubian Relative Clauses

shows a coreferential attributive rc in Kenzi, with the rc marked by the complementizer -l. In both examples, the rc follows the antecedent. In both Kenzi and Nobiin, the rc marker (-ee in ex. 1a; -l in ex. 1b) changes based on whether the rc is coreferential or not. As Old Nubian rcs do not feature any distinctive marking on the right edge, such morphological variation has not been observed.\(^\text{18}\)

In strictly sov languages such as Turkish and Japanese, rcs, like all other modifiers, are prenominal.\(^\text{19}\) In order to account for rcs that seem to be postnominal in sov languages, such as Dutch and Nubian languages, the so-called head-raising analysis of rcs posits that antecedents originate within the rc and move leftward to a position preceding the rc,\(^\text{20}\) leaving a gap or trace in the rc, marked by t.\(^\text{21}\)

\[
[\text{rel } \text{tod } \text{eengi jomel}] \rightarrow \text{tod}, [\text{rel } t, \text{eengi jomel}]
\]

The movement illustrated in ex. 2 itself is subjected to certain constraints, as we will find in §3.4. For the remainder of this paper we will mostly assume this movement, and for reasons of simplicity not indicate it in the examples unless necessary. In certain Nubian languages, including Old Nubian, rcs can also appear prenominally. The motivation here is always semantic. Whereas Abdel-Hafiz does not provide any other type of constituent order, Awad provides us with examples of attributive rcs that precede the antecedent.

\[
[\text{rel } \text{ir-iin } \text{doll-ee}-n] \text{buru } \text{ii} \\
(\text{2sg-gen} \text{love-compl-gen girl nom}) \\
\text{tan-juti-li} \\
(\text{3sg.poss-niece-cop2.prs.3sg})
\]

“The girl you love is his niece”

The postnominal rc in ex. 1a differs in two aspects from the prenominal rc in ex. 3. First, the rc is marked by the genitive case, suggesting that it has moved into the position where normally the genitive-marked possessor would appear; second, Awad indicates that buru can no longer be preceded by the demonstrative man, supposedly because all possessed nouns are by definition determinate. We will see in §3.1.1 that also in Old Nubian, leftward movement of a rc is accompanied by different morphology in the rc and is motivated by semantics. Awad also presents headless rcs as a third possibility, which we will discuss in §4 as free rcs.

\(^\text{18}\) However, there seems to be a specific distribution of the two preterite tense morphemes in attributive relative clauses. See §7.

\(^\text{19}\) Cf. Payne, Describing Morphosyntax, p. 327.

\(^\text{20}\) See, for example, Kayne, The Antisymmetry of Syntax, pp. 86ff.

\(^\text{21}\) Following Comrie’s classification, Old Nubian rcs are of the gap type. See Comrie, Language Universals and Linguistic Typology, p. 151.
3.1 Coreferential attributive relative clauses

Coreferential attributive rc's without an object basically correspond to adjectival constructions with a participle, such as in English “the singing man,” in the sentence “the singing man walks on the street,” which may alternatively be rendered as “the man that sings walks on the street.” The subject of the participle “singing” corresponds with the subject of the main verb “walks,” i.e., “man.” In Old Nubian, these constructions can only be formed by means of a participial form consisting of at least a verbal root, tense/aspect suffix, and the determiner -(e/i)ⲉ/ⲓⲗ, which, however, is dropped before overt case marking. Coreferential attributive rc's generally appear after the noun, and, as a rule, number, case marking, and any other type of right edge suffix (conjunctions, focus, etc.) only appear on the right edge of the entire noun phrase that contains the rc.

We find the following general pattern for coreferential attributive rc's:

```
[ ... Antec-J [ ... Verb-Tense/Asp]]-Det/Num/Case
```

```
cáo pi̇na iɔudai̇os-gou̇ rou̇ ou̇ṅȯtak̇ȯl
is-lȯ pi-nȧ [ ioudai̇os-gou̇-n ou̇rou̇-ou
inter-LOC exist-PRS.2/3SG Jew-PL-GEN king-J
[ouṅ-outak-o]-l
bear-PASS-PTRI-DET
“Where is the born king of the Jews?”
```

The rc, formed by the single embedded verb ou̇ṅȯtak̇ȯl- “born,” follows the antecedent noun phrase iɔudai̇os-gou̇ “king of the Jews,” which is also its antecedent. Note that the antecedent iɔudai̇os-gou̇ ou̇rou̇-ou ends in what I usually refer to as a juncture vowel, whereas Satzinger calls it an “Appositiv”) and Browne the “annective,” “an anaptyctic juncture vowel (‘Bindevokal’) inserted between two words that closely cohere.” The same juncture, or epenthetic vowel may be observed in adjectival constructions and should not be confused with a case ending such as accusative or genitive, as it is purely a noun phrase-internal phenomenon.

23 See Van Gerven Oei, “The Old Nubian Memorial for King George,” pp. 256–62. The precise distribution between the vowels e and i when following a consonant is still uncertain. In Andaandi the different vowels indicate perfective and imperfective aspect, and this may also be the case in Old Nubian. See Jakobi & El-Guzuuli, “Relative Clauses in Andaandi,” p. 91.

24 I have left nominative case marking, which is -0 in Old Nubian, unglossed throughout.

25 Satzinger, “Relativsatz und Thematisierung im Altnubischen,” p. 186 et passim; Browne, Old Nubian Grammar, §3.6.5.

26 The same juncture vowel appears sometimes on personal pronouns, e.g. ex. 32. Its precise distribution, which seems to be of a morphosyntactic nature, has not yet been adequately described.
In this example, in which the final word τογρι remains unaccounted for, the RC under the antecedent τλαυ consists of a single verb ἄγ-, without overt tense marking (and therefore by default present tense) and no determiner -λ due to the presence of the genitive case marking at the end of the noun phrase τλαυ ἄγ-, which is attributive to ἐλλα: “into the hand(s) of the living God.”

Satzinger is correct to interpret the ἡμ in the RC not as a relative pronoun, but rather as a deictic element referring to the emended noun ταυ- “time.” He suggests, contra Browne, that overt complementizers only appear in non-coreferential attributive clauses, which seems to be confirmed by our survey of the extant Old Nubian material. In ex. 7 we again find all nominal inflectional material on the right edge of the noun. The double determiner before and after the plural suffix is a common occurrence (see also exx. 8, 34, 35, 49, 72, 74). Also note the truncated predicative plural -と思いました, where we would, according to Browne, expect -色々. Perhaps it was dropped because of the initial ἐ- of the copula. In the lines following this example, the verb ἡλθανα is repeated several times with different adjectival predicates marked by predicative -κα, except K. 23.4 ὁμηρηκα “ungrateful,” ending with the privative adjective marker -κα, which seems to be directly connected to the verb, and the irregular predicative plural of K. 23.8-9 ἀλλακα “liars.”

The case marking in the embedded phrase is not always complete:

27 In Browne, Old Nubian Dictionary, p. 59, Browne gives the Greek gloss φοβερὸν τὸ ἐμπεσεῖν for ἐγας [... ἐλλα τογρι. It is possible that we are dealing here with a complementizer. Angelika Jakobi (p.c.) suggests that it is an unknown form of the verb τὸ- “to enter,” contributing to the meaning “fall into.”
29 See also Van Gerven Oei, “The Old Nubian Memorial for King George,” p. 260.
30 Browne, Old Nubian Grammar, §3.5.2.
The attributive rc in this example clearly shows how the juncture vowels basically appear inside the noun phrase as a placeholder where we would otherwise expect number and case marking to appear, which, however, no matter how heavy the noun phrase, always appears only at the right edge of the rc. The rc has two peculiar features. First, the accusative case marking that we would expect on ko has been dropped (cf. ex. 20, below). Perhaps this is a scribal error because the author conflated it with the initial kappa of the verb, or perhaps we should interpret the absence of the accusative case with the verb “to have” as an intermediate stage between ko as an active verb with an object in the accusative case, and ko as an adjectival suffix, which is well attested elsewhere. The second curiosity is the appearance of the determiner -l behind the verbal root kon- and before the preterite 1 suffix -o (Browne marks it with a “sic”). Although a determiner in this position has been regularly attested in case of, for example, modal suffixes (e.g. medd-il-ŋ-is-ana potot-ka ouš-enoua ready-det-inch-pt2-3pl.pred trumpet-acc sound-fin.2/3sg “And the seven angels who had seven trumpets readied themselves to sound the trumpet”

3.1.1 Leftward movement: semantic restriction
Whereas in exx. 5–8, the rc followed the antecedent, it may also precede it, as in Nobin ex. 3. There are a few examples present in the Old Nubian corpus that show this inverse order; as is clear from the morphology, we are dealing here with a type of leftward movement that seems to be semantically motivated, and that is restricted to coreferential attributive rcs. This is also suggested by the Nobin exx. 1 and 3, where ex. 3 has a restricted meaning.

Let us inspect this first example:

Browne, Old Nubian Grammar, §3.4.2. According to Jakobi (p.c.), in Andaandi the accusative case marker may sometimes be dropped in the context of the verb ko.

Isameddin Awad, p.c.
Old Nubian Relative Clauses

\[
\text{ⲧⲗ̄ⲗⲕ̄ ⲟⲩⲛⲛⲟⲗ ⲙⲁⲣⲓⲛ ⲉⲓⲅⲟⲛⲗ̄ⲗⲉ ⲅⲟⲩⲇⲁⲗⲁ ⲕⲓⲁ̄}
\]

\[
\text{rel} \text{ till-ik ounn-o]-l [ maria-n t]}][n \text{ eigon-gille}}
\]

\[
goudal-a \ \text{ki-a}
\]

\[
\text{run?-PRED come-PRED}
\]

“Running toward the icon of Mary Theotokos”

Here the RC ⲧⲗ̄ⲗⲕ̄ ⲟⲩⲛⲛⲟⲗ, which supposedly translates the common epithet “Theotokos,” has as its antecedent and subject ⲙⲁⲣⲓⲛ, which itself is attributive to ⲉⲓⲅⲟⲛ- , marked with the genitive -n. Based on our observations in the previous section, we would expect a construction like *ⲙⲁⲣⲓⲛ ⲧⲗ̄ⲗⲕ̄ ⲟⲩⲛⲛⲟⲛ. In this case, however, the entire RC has moved upward and supposedly adjoined to the determiner phrase. The question is what would motivate such movement. First of all, we may observe that in the current configuration, ⲙⲁⲣⲓⲛ- is in the scope of ⲧⲗ̄ⲗⲕ̄ ⲟⲩⲛⲛⲟⲗ instead of the other way around. ⲧⲗ̄ⲗⲕ̄ ⲟⲩⲛⲛⲟⲗ therefore restricts the meaning of ⲙⲁⲣⲓ-; we are not dealing here with a Mary who happened to give birth to God, but rather with the God-bearing Mary. The leftward movement of the RC may therefore be semantically driven. Satzinger suggests that the position of these RCs left of the noun is comparable to adjectival constructions such as ἐξογοι ἱννα “Saint Mina,” although the juncture vowel -ογ cannot appear on verbal forms. This however seems to be contradicted by the existence of a separate class of examples such as άι ειλ/ πεγξι εξενγογκα “the sins that I said” (ex. 20) and ετογοι ἵηογαὶ ἄριστοια “Christ whom you sent” (ex. 21), which clearly show a juncture vowel instead of a determiner (see §3.3.1 below). The movement observed in ex. 10 should therefore have an analysis distinct from adjectives or RCs ending in a juncture vowel.

The same type of movement may be observed in the following, slightly more complicated example:

\[
eiskel-ad-j-amsō \ [ \text{ein gad-kiīn}-ei}
\]

\[
\text{beseech-TR-FUT-PLACT-IMP.1PL DEM.PROX flesh-without-J}
\]

\[
[[\text{ŋook kon-j]}-il \ [ \text{aṅel t]}][n \text{kemsō}-n-gou-ka}}
\]

\[
\text{glory.acc have-PLACT-DET living.being four-PL-PL-ACC}
\]

\[
\text{ouns-illa en-kouannōa}}
\]

\[
\text{love-DAT be-FIN.3PL}
\]

“Let us beseech these four incorporeal, glorious animals that they may abide in love”

33 One example given by Browne seems to resist analysis: SC 18.5 ουλογοριν τίναγογκα ογιογκεραι δογτονια.
If we disregard the initial material in the phrase ṛⲛ ⲧⲏⲙ ⲁⲕⲟⲛ ⲝⲱⲦⲓ ⲣⲟⲟⲕ ⲟⲟⲟⲕ ⲆⲕɅ Ⲟⲏ ⲝⲉⲙⲱ, and focus our attention on the phrasal element ⲣⲟⲟⲕ ⲙⲟⲛ ⲝⲱⲦ ⲆⲕɅ, we find a pattern similar to ex. 10. ⲣⲟⲟⲕ ⲙⲟⲛ ⲝⲱⲦ has moved leftward and adjoined to the determiner phrase. As in the previous example, the motivation may have been semantic in nature, restricting the meaning of ⲆⲕɅ: the “glory-having creatures” instead of the non-restrictive “the creatures that have glory.” We will have to leave the grammatical analysis of ṛⲛ, ⲧⲏⲙ ⲆⲕɅ, and ⲝⲉⲙ Ⲋⲧ ⲑ for the moment, but let me briefly say that relative pronouns always appear in the topmost position of the determiner phrase, and numerals such as ⲝⲉⲙ Ⲋⲧ- always appear phrase final. Note further that the suffix -ⲕⲧ in ⲝⲉⲙ Ⲋⲧ ⲆⲕɅ ⲝⲱⲦ here should be interpreted as the transitivizer -ⲏ with regressive assimilation preceding the pluractional suffix -ⲧ. If it had been the future suffix -ⲧ, it would have followed the pluractional suffix.

3.2 Non-coreferential attributive relative clauses
Non-coreferential attributive rc’s are rc’s in which the subject of the rc does not coincide with the antecedent. In Old Nubian, we can distinguish two subcategories, namely those in which the subject of the rc is overtly expressed (Satzinger’s “Type B1”), and those in which it is not (Satzinger’s “Type B2”). Whereas these rc’s behave similarly when in situ, we will discover that under extraposition this difference becomes morphologically explicit (§6). Also differently from coreferential attributive rc’s, non-coreferential ones may feature a relative pronoun, either ṛⲛ “this” or ⲏⲩ “that.” Another difference is that non-coreferential attributive rc’s cannot move to the left of the antecedent, as described in §3.1.1.

3.2.1 Non-coreferential with an overt subject in rc
In case the subject of the rc is overtly expressed, it nearly always appears in the genitive case, whereas the verb usually shows no agreement, therefore appearing similar to the embedded verbal forms found in coreferential attributive rc’s.

18

13

[... Antec-ј [ј ћ (Rel) [Subj-GEN Verb-Tense/Asp]]]-Det/Num/Case

M. 12.2–3

ong §4.6a

κοϯϯϯου ṛⲛ τα ρ’ ηα κⲇ υ χ Δουμαλ Δούτραπ Δephγα

[ koumpou ћ ћ ћ [ tan-na kip-s] ]-il

egg REL 3SG-GEN eat-PT2-DET

suddenly fowl live-TR-INCH-PRED

“The egg that he had eaten suddenly coming to life as a fowl”

34 See Payne, Describing Morphosyntax, p. 333. I have been unable to find any semantic or syntactic constraint on their distribution.
We find here a non-coreferential attributive rc with a relative pronoun ⲉⲥ in the topmost position. The subject of the rc ⲧⲉⲣⲛ̄ ⲁ̄ⲉⲗ̄ⲁⲩⲁ ⱃⲣⲕⲟ ⲏⲛ ⲉⲓⲣⲛ̄ ⲁⲟⲩⲥⲗⲱ, is marked with the genitive case, and the entire clause is marked on the right edge with a determiner -ⲗ̄. Note also that the juncture vowel that we expect after ⲕⲟⲩⲓⲓⲟⲩ has been dropped after -ⲗ̄.

"He placed concerns within their heart in the valley of tears that you made." (Ps. 83:5–6)

Apart from the slightly erroneous translation of Psalm 83:5–6, which inter alia seems to omit a rendering of ἀναβάσεις and misinterprets αὐτοῦ as ⲧⲉⲣⲛ̄, the clause itself is grammatical and the attributive construction straightforward. The rc with overt subject ⲧⲉⲣⲛ̄ ⲁ̄ⲉⲗ̄ⲁⲩⲁ “that you made” has as its antecedent ⲧⲉⲣⲛ̄ ⲁ̄ⲉⲗ̄ⲁⲩⲁ, ending in a juncture vowel. The embedded verb ⲧⲉⲣⲛ̄- shows no agreement marking because of the overt subject. Finally the locative marker -ⲗ̄ that Browne and Satzinger assume as the marker of the participle or “verbid” only appears in a nominative context as a determiner, and forms no intrinsic part of any “participial” morphology.

3.2.2 Non-coreferential without an overt subject in rc
In case the subject of the rc is not overtly expressed, we find agreement marking on the main verb of the rc. The following pattern emerges:

"And now reveal us the mystery that we ask you about”
The verb of the RC ἐκλαποῦ shows agreement marking, as the subject “we” is not overtly expressed, and the indirect object of the ditransitive ἐκλαποῦ, ἕκκα, is marked with the accusative case. The verb phrase πλαγιὰ ἀεφοῖο in the main clause consists of the verb πᾶς “to shine,” which, together with the causative suffix is usually translated by “to reveal.” The verb ἀεφ- here functions as a benefactive or applicative, adding the semantic role of the indirect object ὧκα “to us.”

Like ex. 16, we find here a non-coreferential attributive RC, with the antecedent προσκολ, without a juncture vowel, perhaps because we are dealing here with a loanword from Greek, or because of the phonologically unstable nature of -ⲓ. The RC ἠκαπα- has as its subject a non-overt third person plural, as can be determined from the morphology on the verb. The object of the verb ἠκαπα- is the antecedent προσκολ.

This example is syntactically rather complex, as it seems that the scribe attempted to imitate the Greek word order of Psalm 46:5 in this bilingual fragment: ἐξελέξατο ἡμῖν τὴν κληρονομίαν αὐτοῦ, τὴν καλλονὴν ᾿Ιακώβ, ἣν ἠγάπησεν (P. QI 2 13.ii.24–28, the Septuagint reads as follows: ἐξελέξατο ἡμῖν τὴν κληρονομίαν αὐτοῦ, τὴν καλλονὴν ᾿Ιακώβ, ᾧ τὴν ἡγάπησεν). The interpretation of the sentence

35 For an overview of the benefactive/applicative in Old Nubian and Nobii, see BECHHAUS-GERST, The (H)istory of Nobin, pp. 142–7.
36 Cf. BROWNE, Old Nubian Dictionary, p. 152.
depends on whether the attributive RC ḫⲕⲱⲃⲓ ⲅⲥⲛⲏⲗⲕⲁ is interpreted as the object of ⲥⲓⲧⲁⲣⲗⲟⲩ or of ⲧⲫⲧⲗⲣⲉⲥⲣⲉⲟⲩ. Browne opts for neither, translating with the rather puzzling “God chose us, making (us) his heirs and the beauty of Jacob, which he loved,” somehow attempting to coordinate ⲧⲫⲧⲗⲣⲉⲥⲣⲉⲟⲩ with the RC, ignoring the accusative case marker. If ḫⲱⲃⲓ is interpreted as the direct object of ⲥⲓⲧⲁⲣⲗⲟⲩ, the entire attributive RC ḫⲱⲃⲓ ⲅⲥⲛⲏⲗⲕⲁ can only be read as an object to the verbal root ⲧⲫ- “inherit,” with possibly the nominalizing predicative plural suffix -ⲧⲧ, causative, and predicative suffix. The interpretation of the attributive construction itself is straightforward. The RC ⲧⲫⲏ ⲧⲫⲓ is dependent on the antecedent ḫⲱⲃⲓ ⲥⲫⲧⲗⲣⲉⲥⲣⲉⲟⲩ, here without a juncture vowel because of the presence of the clause-initial relative pronoun ⲧⲫⲏ.

In a few rare cases, we find that both the genitive subject and person morphology on the verb may be overt in the RC:

\[
\text{elon-de-eion dekk-igir-men-dre-lo} \quad [\text{nee-ou } [\text{el ein} \\
\text{now-C-C conceal-CAUS-NEG-FUT.1SG.PRED-FOC thing-J REL} \\
[\text{oun-na ai-ka ekid-rou}]]] \text{-k-on} \\
\text{IPL.EXCL/2PL-GEN 1SG-ACC ask-PRS.1/2PL-ACC-C} \\
\text{“And now also I will not conceal the thing that you asked me”}
\]

The RC, indicated by the relative pronoun ⲧⲫⲏ has as its antecedent ḫⲱⲃⲓ, ending in a juncture vowel, and the entire attributive RC is the object of the verb Δⲧⲫⲧⲩⲧⲧⲩ. What is curious about the RC is that it features both an overt subject ⲧⲫⲏ in the genitive case and the verb ⲧⲧⲩⲧⲩ-, with overt person morphology. Satzinger suggests an interpretation of this double occurrence of overt subject and agreement marking by supposing a disambiguation strategy, mistakenly assuming that ⲧⲫⲏ is exclusively the genitive-marked pronoun for the second person plural, which is not the case. So neither the overt subject, nor the overt person marking disambiguates the other; it is the indirect object ⲧⲫⲓ that makes a reading “the thing that we (EXCL) asked myself” rather implausible.

3.3 More on the left
There are several examples of non-coreferential attributive clauses appearing in a position that precedes the antecedent. In these cases we are dealing with two patterns. In the first pattern, RCs seem to have been generated in situ, and are marked with the juncture vowel that we normally find on the antecedent when it precedes the RC, whereas the antecedent is marked with the customary number and

37 Browne, Old Nubian Grammar, §3.5.2e.
case marking (§3.3.1). In these cases, the rc seems to appear in the position of the adjective. The second pattern, which only occurs in the case of rcs of time, place, and manner, the rc is either generated in the position of the possessor, or is moved there, being marked by the genitive case (§3.3.2).

3.3.1 Preceding non-coreferential attributive rcs
As we have seen in §3.1.1, preceding coreferential attributive rcs are the result of movement driven by semantics. These clauses also show a specific morphological pattern, always being marked by the determiner -κ. There is, however, also a small class of examples that feature a non-coreferential rc preceding its antecedent, which seems to be constructed in a way similar to phrases such as ἠδελφός ἡμῶν, where the adjective precedes the noun.

This complex example from one of Griffith’s graffiti contains several rcs which we will inspect in more detail below in ex. 62. Note here, however, the attributive relative construction ΔΙ ΕΙΛΑ/ ΠΕΣΣΙ ΕΛΕΝΕΡΓΟΥΚΛΑ, the object of ΤΟΚΑΡΑ. It seems to be the case that the non-coreferential rc ΔΙ ΕΙΛΑ/ ΠΕΣΣΙ precedes its antecedent ΕΛΕΝΕΡΓΟΥΚΛΑ. Moreover, unlike the examples in §3.1.1, it is marked by a juncture vowel -ι and not by a determiner, and its subject appears in the nominative instead of in the genitive case. Another example shows a similar pattern:

"And to know Jesus Christ whom you sent" (Jn. 17:3)

Again this is an example taken from a larger, more complex sentence (ex. 79). But as in ex. 20 we may notice the non-coreferential attributive RC ΕΙΤΕΝΟΥ preceding its antecedent ΙΗΣΟΥΣ ΧΡΙΣΤΟΣΙΑ. In both cases, an explanation as in §3.1.1 seems unlikely, in the sense that the marking of the rcs and antecedents follow exactly the same pattern as in exx. 5–8, albeit with rc and antecedent in reverse order. Also the fact that the rc in ex. 20 shows a nominative subject,
Old Nubian Relative Clauses

suggests that we are dealing here with a different type of construction. However, there is not enough Old Nubian data and an absence of comparative data from modern Nile Nubian languages to allow for a full explanation.

3.3.2 Non-coreferential relative clauses of time, place, and manner

As already suggested by Browne and Satzinger in their respective treatments of rcs, expressions of place and time follow a different template, in which the rc is marked with a genitive case and always precedes its antecedent.

Mary-c Jesus-gen be-pt2-gen place-loc come-prs.2/3sg
And when Mary came to the place where Jesus stayed

The attributive relative construction could also be literally translated as “to the place of Jesus’s staying,” and is otherwise grammatically unremarkable. The following examples provide further illustration:

And all the time that they existed they were like each other

And at the time that they were near Jerusalem

Note that in this example the genitive -n has merged with the tense/person marker -can.

The same strategy may be observed in Nobiin, where rcs of place and time always seem to precede their antecedents, and are marked with the genitive case. For example:

This example contains a free relative clause, see §4.
As in the Old Nubian examples above, the antecedent agar follows the RC irin koraga bataree-n, which is marked by a genitive. Note, however, that this pattern, which in Old Nubian is only found in case of RCs of place and time, seems to have been generalized in later stages of language development until the attributive RC construction of RC + genitive preceding the antecedent became a commonly accepted pattern for all restrictive RCs (cf. Nobin ex. 3).

In the same context, Awad’s discussion of RCs of manner in Nobiin also allows us to shed light on an otherwise obscure construction in what Browne identifies as the Old Nubian version of a homily attributed to St. John Chrysostom:

The syntax of this fragment is complicated, as there is only one main verb, ankimihineco, with object τᾶλκ and its apposition αὐρούτκα. In the second part of the sentence the same verb is implied, with the entire clause γαλαλεγεῖνα ακ[α]ατ’ αὐρούτκενα- as object. In the third part the object of the implied verb is ἀδικανγούκα, οὐερίγαρεσκ- here is technically not an extraposed RC (see §6), but rather an apposition just like αὐρούτκα, in a construction “consider x as y.” The form γαλαλεγεῖνα in the second part of the clause, however, seems more puzzling. If we followed Browne and translate γαλαλεγεῖνα ακ[α]ατ’- as “construction that became flesh” (his Greek retrotranslation has οἰκονομίαν for ακ[α]ατ’-) we would not expect to find a coreferential attributive RC to precede with this type of complex morphology: no agreement ought to be present in coreferential attributive clauses (cf. §3.1.1), and the -α suffix would remain completely unexplained. If we would apply our observations thus far, we would conclude that γαλαλεγεῖνα must be a non-coreferential attributive
Old Nubian Relative Clauses

RC, and Browne’s translation of $\lambda k[\lambda ]\lambda t$- as “construction” and subject of $\lambda \lambda \lambda \lambda \lambda \lambda \lambda \lambda$ is incorrect. Moreover, it follows none of the patterns observed in §3.3.1; in that case we would expect something like *qadañesi akdatt-. The only remaining option is that we are dealing with some type of RC of place, time, or manner, which ends in a genitive and precedes its antecedent. This assumption allows us to explain the agreement suffix -$n$ (the RC is non-coreferential without explicit subject), the subsequent genitive -$n$ (RC of time, place, or manner), and its position in front of the antecedent. However, the -$n$ would remain unaccounted for; in exx. 22–5 the genitive case always appeared as -(i)$n$. If we observe the following example from Nobiin, however, it becomes clear that we are dealing here with a predicative -$n$, which may have been preserved in Nobiin in RCs of manner as a same-subject converb:

<table>
<thead>
<tr>
<th>man</th>
<th>ideen</th>
<th>an-een</th>
<th>aaw-ee-n</th>
<th>a</th>
<th>kir</th>
</tr>
</thead>
<tbody>
<tr>
<td>dem.dist</td>
<td>woman</td>
<td>1sg.pos</td>
<td>mother</td>
<td>do-compi-gen</td>
<td>ssc</td>
</tr>
<tr>
<td>jelli-ga</td>
<td>aaw-i</td>
<td>job-acc</td>
<td>do-prs.3sg</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

"The woman does her job in the same way as my mother does"39

We may observe here that the RC aneen aaween-a preceding the antecedent kir is marked by both the genitive and a, here glossed as same-subject converb. However, recall that one of the functions of the Old Nubian predicative suffix -$n$ is precisely marking verbs with the same subject. I suggest that the same is the case in ex. 27, and that consequently the translation of $\lambda k[\lambda ]\lambda t$- in ex. 26 as “construction” is erroneous. In his Old Nubian Dictionary, Browne rightly observes that we are probably dealing with some type of nominalized form with -$t$ of the habitual verb $\lambda k$, or its derivative $\lambda k\lambda k\lambda k$- “to set up,” which already suggests a mode or manner of doing things. The suggested Greek retrotranslation οἰκονομίαν suggests something similar. I have therefore opted here tentatively for the neutral translation “order” while suggesting that just like in Nobiin ex. 28 we are dealing with a RC of manner.

3.4 Anaphors

According to the head raising analysis of RCs, antecedents of an RC are originally generated within the RC and subsequently move up to a higher (in the case of Old Nubian, leftward) position. Without delving into the technical details, this movement may explain the appearance of the juncture vowel that we mentioned before, and the fact that the neutral position of attributive clauses seems to be

39 Cf. also Awad, The Characteristic Features of Non-Kernel Sentences in Nobiin, ex. 633.
following the noun, rather than preceding it. It also predicts that there are certain syntactic positions within the rc, organized on a hierarchical scale,\(^{40}\) that do not allow for relativization, such as possessor and postposition phrases. Old Nubian seems to conform this generalization: subjects and objects can be relativized (also called extracted), whereas other syntactic functions cannot.\(^{41}\) In case relativization is impossible, we find an anaphor — also called pro or “re-sumptive pronoun”\(^{42}\) — which in Old Nubian is always a form of the third person singular pronoun ταπ.

Ex. 29a follows the pattern of non-coreferential attributive clauses discussed in §3.2.1, but this time we find an anaphor ταπ “his” coindexed with the antecedent εττογ, as possessor phrases do not allow extraction. The same occurs in Andaandi in ex. 29b, where we find the anaphor τεν in a similar position. Anaphors also appear in the case of oblique phrases such as locatives:

---

\(^{40}\) See Keenan & Comrie, “Noun Phrase Accessibility and Universal Grammar.”

\(^{41}\) Owing to a lack of examples, it is unclear whether indirect objects can be extracted, that is, can become an antecedent to an rc in which its syntactical function would be that of an indirect object, e.g. “the person John wanted to give a present to.”

\(^{42}\) Jakobi & El-Guzuuli, “Relative Clauses in Andaandi,” p. 97.
Old Nubian Relative Clauses

“This is the country to which I came before”

Just like ἐπίγειον in ex. 29a, ἄλαγ cannot be extracted from a postpositional phrase in the RC, which is the reason why we find the locative-marked anaphor τὰριό. Browne’s suggestion that ἐν is here a postponed “regular” demonstrative pronoun is erroneous; demonstrative pronouns in Old Nubian never follow nominal heads. The same construction can be found in Andaandi, ex. 30b. A similar anaphor construction is found in the next example, which however cannot be faithfully rendered in English:

κοἵρ δι' ἐν τὰριό δωκ[κα] κ[α]πτάμμα
[koeir, rel ein [ el tar io jōo]]-k-ka
(tree REL NOW 3SG-LOC go-DET-ACC
kap-a-tamē-a
eat-PRED-VET.2SG-QUOTE

“Do not eat that which now comes from the tree’ (lit. ‘do not eat the tree which now comes from it’)”

Finally, anaphors also appear in contexts in which raising is impossible due to intervening constituents, such as adjectival phrases:

Δούκιιὶ ἵνα ἑταιρεῖ δοοκκόλ τὰλαλοκὸ τὰροὺ εἰτακάκα
douk-imme [ en engane, nookko-l]
pay.homage-AFF.1SG 2SG.GEN brotherhood glorious-DET
[rel till-ilokō tar ou ei-tak]-il-ka
God-by 3SG-J bless-PASS-DET-ACC
“I pay homage to your glorious brotherhood, blessed by God”

In this example, the adjective δοοκκόλ intervenes between the antecedent ἑταιρεῖ and the RC τὰλαλοκὸ τὰροὺ εἰτακάκα, hence the appearance of the anaphor τὰροῦ.

The strategies of exx. 31 and 32 may also appear together:

Εἴσαιρ Κάυκα ἐν Λιθ. εἰς ταῦτα εἰγοῦλα [ο]γογούλα Τᾶλαλοκὸς Αἰκηνόσικα
ed-d-tō [ kaj ka, rel ein [ dig]]-el
find-FUT-PRES.2PL colt-ACC REL bound-DET
[rel eil tad ou [ ei-gou-la ouen na tad dō ak-imis s]-ika
now 3SG-J man-PL-DAT one-GEN 3SG-UPON sit-NEG-PT2-ACC

“You will find a colt that is bound, one upon which no one among men has yet sat” (Mk. 11:2)
In this example, καρκα is coindexed with both ταξανοι and ταξανοι in the RC dependent on it, in the first case because of the intervening RC εν τω λε.photo, and in the second case because ταξανοι is an inaccessible postpositional phrase. Note also that the accusative case ending on καρκα is unexpected. Owing to a lack of comparative evidence I am unable to suggest an explanation, but see the commentary to ex. 89 for further discussion.

4. Free relative clauses

Free or headless RCs have no overt antecedent, but are otherwise syntactically similar to the coreferential and non-coreferential examples discussed in §1. Whereas Satzinger does not discuss them separately, and subsumes them under his main types “A” and “B,” Browne treats them separately in Old Nubian Grammar, §4.7.1. Headless RCs may further be subdivided into subject clauses (§4.1); object clauses (§4.2), which include different types of complement clauses (§4.2.1–2); and free RCs in other, oblique positions (§4.3). Unlike non-coreferential attributive clauses, free RCs are never introduced by a relative pronoun.

4.1 Subject clauses
Subject clauses are RCs that in their entirety, i.e., without antecedent, form the subject of a sentence.

Satzinger includes this example as a “Type A” RC, interpreting αγενδαγουλω as an antecedent, but when compared to ex. 29 it becomes clear that we are dealing here with a subject clause, that is, a free RC without antecedent. The entire RC ειρν γογα λογι is the subject of the adjectival predicate αγενδαγουλω, which agrees in number with the subject. The same holds for the following example quoted by Satzinger as an attributive RC, which in fact appears to be a coordinated subject clause:

ειν εκκανα εγηκτε ειγονκα δουκαγουλα ταν ταξει εκκον τεν κοριν τηιαταδω ετολγουλα·
“Those have been the ones who worship the image of the beast, who received the sign of his name upon their forehead.” (Rev. 14:9)

Just like the previous example, the interpretation here is straightforward. The subjects of ⲉⲥ̄ⲥⲁⲛⲁ are two subject clauses coordinated by the suffix -ⲟⲛ in the noun phrase ⲧⲛ ⲧⲁⳝⲛ̄ ⲉⲇ̄ⲕⲟⲛ. Both subject clauses are fully marked with a plural suffix and the double determiner construction we have seen previously.

A final example is slightly puzzling, in the sense that we are not strictly dealing with a subject sentence, but rather with a sentence that as a whole seems to have been nominalized:

“(The fact that) I say these things to you” (Jn. 16:33)

To take ⲉⲛ̄ⲛⲛ̄ⲕⲁ here as the antecedent of the RC ⲧⲛ ⲧⲁⳝⲛ̄ ⲉⲇ̄ⲕⲟⲛ makes no sense, as it would not be marked with the accusative case (but cf. ⲟⲩⲁⲧⲉⲣⲗ̄ in ex. 33); it can be nothing but the direct object of ⲡⲉⲥⲓⳝⲉⲣⲗ̄. However, this leaves the occurrence of the determiner -ⲙlz unexplained. Perhaps the scribe was attempting to render the perfect tense found in the Greek (ταῦτα λελάληκα ὑμῖν) by nominalizing the entire sentence. Again, lack of comparative evidence prevents further speculation.

4.2 Object clauses
Object clauses follow the same pattern as subject clauses, but are obviously marked by the accusative case -ⲙⲁ, sometimes preceded by the determiner -ⲓⲧ. As yet it remains unclear in which contexts the determiner may precede the accusative suffix.
“Do the things you do in God’s name joyfully”

The free RC ⲡⲧⲗⲛ̄ ⲧⲁⳟⲥⲗ̄ⲇⲟ ⲁⲩⲟⲩⳝⲁⲛⲁⲥⲱ is here the object of ⲁⲩⲟⲩⳝⲁⲛⲁⲥⲱ.

Note that the implicit antecedent of the RC is plural, as signified by the pluractional marker -燎 on both the embedded verb ⲁⲩⲟⲩⳝⲁⲛⲁⲥⲱ and the main verb ⲁⲩⲟⲩⳝⲁⲛⲁⲥⲱ.

Observe that in ex. 38 we find two instances of a determiner that are relatively rare, the first preceding the accusative case in ⲇⲟⲗⲓⲥⲗ̄ⲕⲁ (cf. ex. 25, 31 ⲕⲕⲁ and ex. 32 ⲉⲓⲧⲁⲕⲗ̄ⲕⲁ) and the second directly following the verbal root in ⲉⲓⲁ̄ⲣⲗ̄ⲅⲁⲥⲉⲥⲛ̄ (cf. ex. 8 ⲕⲟⲛⲗⲟⲩⲗⲗⲟⲛ). As for the curious form ⲉⲓⲁ̄ⲓ, with either a phonologically reduced predicative suffix or a juncture vowel, cf. ex. 21 ⲉⲓⲁ̄ⲣⲓ.

Ruffini’s translation is different here, analyzing ⲉⲓⲇⲕⲁ as a serial verb consisting of ⲉⲓ- “to take” and ⲍ- “to take, bring” with the accusative case, rendering it with “receipt.” However, it seems to me that an analysis as a free RC, just like ex. 38, is more likely. I also take ⲉⲓ- to be a rare instance of the verb ⲉⲓ- “to send?,” but obviously “to take” remains a valid option as well.

4.2.1 Complement clauses with verbs of reporting and desiring

Object clauses are a subcategory of complement clauses which may appear with verbs of reporting and desiring such as “believe,” “say,” “wish,” “think,” “write,” and so on. Grammatically speaking, Old
Nubian complement clauses do not differ from regular object clauses, or non-coreferential RCs in general. The subject of the complement clause, if overtly expressed, will appear in the genitive case, and the entire clause will be marked by the accusative case. As with regular non-coreferential attributive RCs, there is a complementary distribution between overt subject and the presence of agreement morphology.

Here we find a complement clause dependent on the verb \textit{pisteu-eis-ana}, with a genitive subject and an embedded verb solely marked for tense. There is no overt agreement marking because the subject is explicit. The object clause \textit{eir-es} is marked with the accusative case as an object of the main verb \textit{pisteu-eis-ana}. Cf. also L. 107.4–5 κοσμοι λ[κκοσι]νοα \textit{ein aik ei trợeka (sic) “So that the world knows that you sent me.”}

In this example we find explicit person marking on the embedded verb owing to the absence of explicit subject. The object clause \textit{eir-es} is marked with the accusative case as the object of the main verb \textit{doll-immo}.

If there is an explicit subject in the complement clause, it is marked by the accusative case.

(42) P. QI 4 91.1.6–7

\begin{verbatim}
ai-on \textit{eik-ka} tar-ia-kon sipitor ann-eika
1SG-C 2SG-ACC 3SG-LOC-C foundation 1SG.GEN-ACC
tir-men]-ka  eid-do ounn-ir-a-ma
give.2/3-NEG-ACC 2SG-FROM love-PRS-PRED-COP
\end{verbatim}

“And I want from you to not give from it to you and to my foundation.”
The subject of the complement clause εκκα is here marked by the accusative. Ruffini translates slightly differently here, choosing to render εκκα as “for you.” This example shows several curious features, such as the absence of tense and agreement morphology in the verb of the complement clause τρανκα. Observe also the so-called copulative suffix -ια on the main verb, with the element -ι that otherwise appears in emphatic environments such as the affirming and vetitive. Finally, note the inverse order of possessed and possessor in στιτορ ληνικα, with the genitive ληνι- following στιτορ.

In ex. 43 we find a double object construction, with indirect object εκκα and complement clause καυ εκκα. The double object construction is supported by the applicative verb τιρ-, usually translated with “to give.”

For comparison, observe the following two examples from Nobiin, respectively with an intransitive and transitive verb in the complement clause, which feature a similar construction with genitive-marked subject and accusative marker on the complement clause:

4.2.2 Complement clauses with verbs of ability
Other types of complement clauses have been attested in combination with variants of the verb ειρ- “to be able,” which, just as the verbs of reporting in §2.2.1, takes a complement clause marked by the accusative case. The two following examples show such a complement clause construction embedded under ειρ-.

43 See also P. Q1 4.3–4 elon eimme tillika [...] tiddeka.
44 The morphology of negative contexts is still not completely understood for Old Nubian. But cf. Nobiin example tar fentiga kab-i “He eats the date,” with tense/agreement suffix, and tar fentiga kam-muun with a negative portmanteau suffix (AWAD, The Characteristic Features of Non-Kernel Sentences in Nobiin, §3.1.1.1, table 31). Perhaps the same is the case with τρανκα.
45 BROWNE, Old Nubian Grammar, §3.10.
Old Nubian Relative Clauses

iskel-itt-il-dekel-ka \ [θ [rel [comp diar-iō tak-ka
pray-nmlz-det-c-acc death-loc 3sg-acc
auoul-os]-ik eir]]-il-gille
save-compl-acc be.able-det-dir
“...and prayer (acc) to whom is able to save him (away/completely) from death.”

The complement clause Διἀρῳ τακ[κ]α Άγωγλόκ shows the object of the verb εἰρ- and therefore marked with the accusative -κ. The entire free RC Διἀρῳ τακ[κ]α Άγωγλόκ εἰράγγελλε is then marked with a determiner and directive suffix: “to whom is able to save him (away) from death.” According to Bechhaus-Gerst, the suffix -όκ in Ἀγωγλόκ should be interpreted as a “movement away from a […] deictic center,” which can also carry the meaning of fully completing a certain action, in casu the saving.

ɾʰента- εἲν δογيتها άφαν τηρίκα τίκκιγαρολ εϊκετάλ Διηνήναρικα/ ir-men-ta [θ [rel ein douŋ-in mañan tri-ka
be.able-neg-neg dem.prox blind-gen eye.pl-acc
pikk-igar-o]-l [comp ein-ketal di-minn-a-gar]-ika
awaken-caus-ppl.det dem.prox also die-neg-pred-caus-acc
“Is the one who opened the eyes of this blind man not also able to raise this one from the dead?” (Jn 11:37)

The main verb ɾʰента here shows the compounding of the two negative suffixes -μεν and -τα, which is only attested with the verb ἐιρ- “to be able” and Δι “to die.” Again note the absence of person morphology in the negative verb, as observed in ex. 42 ɾʰεντκα. Assuming, with Browne, that we are dealing here with the introduction to a question “Is (he) not able to...?,” the clause εϊκετάλ Διηνήναρικα is a complement to ɾʰента, marked by the accusative case -κα. The subject of ɾʰента is formed by the subject clause εἲν δογيتها [...] τίκκιγαρολ “the one who opened the eyes of this blind man.” εἲ should not be interpreted as a relative pronoun, as these never appear in free RCs.

Again we find a similar construction in Nobiin:

[comp ay sirig-ka kay-inan]-ga esk-ir-i
1sg boat-acc make-inf-acc be.able-prs-1sg
“I am able to make a boat”

4.3 Other free relative clauses

Except for subject and object positions, free RCS may also appear in other positions in the sentence.

The free RC here is Ἀλληλούϊα Ἀλληλούϊα with those who sing Alleluia, with the antecedent “those” implied.

This example contains two free RCS, the first ἰδιοκται οὐκελ ἀπηθ ὑπάρχει ὑπάρχει ἐφάρμοσθε ἐφάρμοσθε ἐφάρμοσθε as subject of the sentence and the second ὑπάρχει ὑπάρχει ὑπάρχει ἐφάρμοσθε ἐφάρμοσθε as a genitive belonging to ὑπάρχει. Satzinger suggests an “unexpected” interpretation of the suffix -ιν in ὑπάρχει as third person singular morpheme, whereas the fact that the RC precedes its antecedent and the presence of the verb ὑπάρχει-, which besides “to be” can also mean “to come out,” suggest here a genitive case.

We are now able to analyze a complicated sentence such as the complete verse of Heb. 6:7, which contains a number of embedded RCS:
Old Nubian Relative Clauses

[iskt-ou [rel [app ȝedian-no [arou [rel tad-dō jôn-a earth-J often-LOC rain 3sg-upon strike-pred soukk-o]-l-ka sirip-a et-a tor-a]
descend-pt1-det-acc drink-pred take-pred enter-pred [des dess-ou [rel el-takk-ou]-l-ka]
crop green-J obtain-pass-pt1-det-acc [θ [rel ein [tak-ka torpak-k]]]-l-gou-ka
REL 3sg-acc harvest-consuet-det-pl-acc pee-i-a os-a tij-j]-il-de produce-pred come.out-pred give.2/3-plact-det-c
till-illo-jōa taoue-ka et-ara-goue-lo God-loc-through blessing'acc receive-pt1.pred-pl.pred-foc
“And the earth which, drinking up the rain that often strikes upon it, produces obtained green crops for those who harvest it, received blessing(s?) from God” (Heb. 6:7)

The subject of the verb at the end of the sentence, ἐταρα- is the entire clause ἐκτού […] πεεὶ ὃς θάκας “and the earth which produces….” The RC ending in the verbal complex πεεὶ ὃς θάκας has as its object ἐκτού ἐλτάκκουλα “obtained green crops,” with a slightly curious verb ἐλτάκκουλα-. I have opted here to interpret the morpheme -胝 as a variant of the preterite 1 morpheme, both because it is a coreferential attributive RC (cf. §7 below) and an interpretation as an agreement suffix would make no sense. The indirect object, supported by the applicative verb θά-, is the free RC εἰν ἐκθεύ-κα ἀρτίφακα “for those who harvest it.” All of this is preceded by a lengthy apposition ἔδαννο […] σεπία ἐτὰ το[πα(?)] “drinking up the rain that often strikes upon it,” which in turn contains a coreferential attributive RC with antecedent ἄπο. Note that both σουκκόλα and ελτακκούλα retain the determiner before the accusative case.

5 Relative clauses and predicative -ѧ

As Satzinger points out, in case the antecedent of an RC is marked with the predicative, both the RC and its antecedent will feature the predicative suffix. The predicative -ѧ therefore behaves differently from genuine case markings such as the accusative -κα and genitive -να, which only appear at the right edge of the noun phrase. The precise syntactical structure underlying the assignment of the predicative case, however, still lacks clarification. What follows will therefore be a description of the different types of RCs that we have
encountered in the previous sections in the different contexts in which a predicative suffix appears.49

5.1 Nominal predicates
The predicative suffix -ⲧ first of all indicates the main verbal or nominal predicate of a sentence. In case the nominal predicate is accompanied by a RC, it is also marked with the predicative.

5.2 Complex verbal predicates
What Browne calls “periphrastic” constructions are in fact not essentially different from the complement clauses we have discussed above in §4.2.1–2, namely a full sentence embedded under a verb. In most instances of such constructions,50 the main verb is a copula without any overt tense marking, whereas the RC is marked with the predicative, like a regular nominal or verbal predicate. The embedded verb can either appear with or without agreement morphology. I will just give a number of representative examples.
"But nevertheless cease disobedience, because disobedience produces death"

"And he will be judged in fire and sulphur" (Rev. 14:10)

"If I give birth, I will become a Christian"

"...about ... it is impossible to speak individually" (Heb. 9:5)
Complex verbal predicates can of course in turn be embedded, such as in the following example:

“The magi, coming from the east, arrived in Jerusalem, and said: ...”

The RC ⲡⲉⲥⲣⲁ̄ⲅⲟⲩ[ⲉ̄] ⲉⲓⲛⲓⲗ is attributive to ⲇⲟⲅⲇⲣⲓ̈ⲅⲟⲩⲗ in spite of its distance. And although it is nominalized with the determiner -ⲉⲓⲗ, the internal structure of the clause remains the same: the copula ⲉⲓⲛ preceded by an RC marked by the predicative suffix, as well as number agreement with its antecedent.

5.3 Vocative or appellative contexts
The predicative -ⲡⲉⲥⲣⲁ̄ⲅⲟⲩⲉ̄ⲕⲉ appears also in vocative or appellative environments, where someone is called or called upon.

Both examples contain a free RC which is marked by a predicative -ⲡⲉⲥⲣⲁ̄ⲅⲟⲩⲉ̄ⲕⲉ, with plural predicative suffix -ⲡⲉⲥⲣⲁ̄ⲅⲟⲩⲉ̄ⲕⲉ, and in both cases a special vocative suffix that refers to the second person plural “you,” -ⲡⲉⲥⲣⲁ̄ⲅⲟⲩⲉ̄ⲕⲉ. Otherwise the RC seems to behave grammatically like the ones discussed above, such as marking the subject with a genitive case.

Other examples are grammatically a bit more complex:
Old Nubian Relative Clauses

We are dealing here with regular non-coreferential attributive RC in which both the antecedent ꠇⲟⲕⲕⲟⲣⲁ and RC ⲭⲣⲓⲥⲧⲟⲥⲛ̄ [...] ꠇⲥ̄ⲥⲟⲩ are marked with the predicative -Ⲋ. The RC shows no agreement marking, as the subject is overtly expressed, with a genitive suffix. The example in question is the first sentence of the text known as the Miracle of St Mina (or Menas) and as such functions as a type of announcement or caption for the entire story.

This vocative-like usage of the predicative suffix also appears in other contexts, for example in one of Griffith’s graffiti. I give here an extensive fragment:

Peter, the one who is called upon here by the author of the graffito, is qualified by two coreferential attributive RCs, both ending in the predicative suffix -Ⲋ. The first coreferential attributive RC shows the pattern we have seen before, whereas the second one contains an additional non-coreferential attributive RC ꠅⲓ ⲅⲓ⸌ⲁ⸍ ⲡⲉⲥⲥⲓ, with the antecedent ꠇⲁⲡⲉⲅⲟⲩⲕⲁ (see ex. 20 for discussion). This lengthy appellation to Peter is then followed by an imperative ꠇⲛⲉⲥⲱ and a veṭitive ꠕⲕⲡⲣⲁ ⲅⲧ̄ⲧⲁⲙⲓⲥⲱ.

51 Browne, “Griffith’s Old Nubian Graffito 4,” p. 19, translates “O Peter, you who have the keys of the 7 heavens, forgive me for the sins that I uttered. Cause me not to eat tribulation in the time of my life,” interpreting ꠗⲟⲕⲁⲣⲁ as an imperative and ꠆ⲓⲏ as the object of Ⲁⲧ̄ⲧⲁⲙⲓⲥⲟⲩ instead of ꠇⲁⲡⲉⲅⲟⲩⲕⲁ.
5.4 Adjunctive/appositional clauses
Satzinger gives a few other examples in which the predicative -ⲥⲓⲛ appears. These, however, are not proper rc's, i.e. with a fully developed clausal structure including tense and subject and/or agreement morphology, but rather embedded verb phrases without any higher projection, without possible subject, and without ever featuring a relative pronoun. Needless to say, all of them are coreferential.

5.5 Topicalization of the antecedent
There are a few recorded cases of rc's with an antecedent marked by the predicative suffix that seems to have moved to a more leftward position. In all of these cases we are dealing with a topicalized antecedent, as signaled by the appearance of the “emphatic” suffix -ⲥⲓⲛ and the predicative suffix. However, as predicative morphology is not always present in the rc itself (as in exx. 52–62), it may be the case that this assignment only takes place after movement of the antecedent. In all examples below, the movement is not visible on the surface. The intuition that leftward movement is involved derives from 1) the fact that -ⲥⲓⲛ does not always appear in these contexts and that its presence must be linked to a specific syntactic position in the sentence, and 2) the abundant presence of -ⲥⲓⲛ in contexts of quantifier raising, which in other languages explicitly features leftward movement (see §5.6). This type of -ⲥⲓⲛ-topicalization is allowed from both coreferential and non-coreferential attributive clauses.

52 There is no room here for a full discussion of the -ⲥⲓⲛ morpheme, which has been analyzed by SATZINGER, “Relativsatz und Thematisierung im Altnubischen,” pp. 195ff; BROWNE, Old Nubian Grammar, §3.10; BROWNE, Old Nubian Dictionary: Appendices, pp. 28–37, esp. p. 31 “Predicative + -ⲥⲓⲛ as Antecedent”; and BECHHAUS-GERST, The (Hi)story of Nobiin, pp. 103–4.
Old Nubian Relative Clauses

In this example, τάλακι has apparently moved to the left, and has been marked by the emphatic suffix -οι. Note that the RC σαλω ωλολοδικα is marked with the predicative -λ.

This series of appeals to God contains one RC κορκα ἐτολογονάσιον, with the antecedent αἰγογέçı, which clearly has moved out of genitive construction into a higher position in the phrase, where it has been marked with the emphatic marker -οι, and the predicative marker -λ. More clear than ex. 66, this example is perhaps evidence of οι-topicalization as both the predicative -λ and -οι are assigned in the target position, whereas the RC is not marked by the predicative, but rather with the genitive, as attributive to ἱκτορός.

"Hearing the women of the Christians talk about the miracles that Saint Mina performed in the church of Mareotis"
This is another example in which the antecedent ταῦτα:γουές:νι has moved leftward and become marked with the predicative and emphatic markers. Again the RC is not marked with the predicative –ⲅ, but with the accusative.

This final example first shows a complement clause ἀρόικα dependent on the verb of ability εἰρίμνεια (see §4.2.2), followed by the antecedent εἰς:γο:γευ:ς:νι of the RC ἁγιο:σί:νια. As in ex. 67, the antecedent has moved out of a possessor phrase, here dependent on the object of ἀρόικα, ἀρόικα. Note that the analysis of –ι in ἀρόικα is uncertain. Because the subject of the RC ἁγιο:σί:νια is explicit, we normally do not expect to find agreement morphology. The only other option is that we are dealing here with an assimilated form of the determiner –ι, which, however, never seems to appear before the genitive case.

5.6 Relative clauses within the scope of quantifiers
A special instance of attributive RCs marked with the predicative suffix are those whose antecedents are the quantifiers ἀ:νω:λι “all” and ο:γε:λ “any” which mark constituents within their scope with the predicative –ⲅ. Apart from featuring this additional marker, the RCs have also moved into the scope of the quantifier and are therefore structurally similar to coreferential RCs with a restricted reading as discussed in §3.1.1.\(^5\)

53 Leftward movement of the RC has not been indicated in the examples below.
Old Nubian Relative Clauses

This example features a coreferential attributive RC embedded under the antecedent mḥwàn- and therefore marked with the predicative. Although Satzinger follows Browne in claiming that because of this predicative marker before mḥwàn- “es steht Prädikativ statt Verbid, und Indikativ statt Subjunktiv;” such a statement is meaningless in a descriptive context in which we attend to Old Nubian morphology, under the assumption that it is more an agglutinative rather than a synthetic language. Note also the complex verbal predicate with copula and predicative-marked ḫญwạ- (cf. §5.2).

The grammatical analysis of this sentence, with no less than four accusative marked constituents, does not appear straightforward, and it is helpful to look at the Textus Receptus from Jn. 17:2, which Browne identifies as the verse that is translated here. In Greek we read ἵνα πᾶν ὃ δέδωκας αὐτῷ δώσῃ αὐτοῖς ζωὴν αἰώνιον, and at first sight it seems that the Old Nubian follows the Greek original rather faithfully, perhaps to the detriment of its own grammatical coherence. The purposive construction ἵνα [...] δώσῃ “in order to, so that you give” is translated in Old Nubian by the (emended) final verb form [ⲧⲉⲕⲕⲁ] whose indirect object αὐτοῖς is rendered with the accusative ṭⲏⲕ- and direct object ζωὴν αἰώνιον with ḫญwạ-ⲁ. The translation of the Greek phrase πᾶν ὃ δέδωκας αὐτῷ, with πᾶν “everything, all” in the accusative case and rendered in Old Nubian ṭⲏⲕ- is somewhat less intuitive. Note both the genitive subject ṭⲏⲕ- and agreement marking on ṭⲏⲕ- are explicit, to avoid any ambiguity. The King James Bible translation of the Textus Receptus gives the rather fluent “that he should give eternal life to as many as thou hast given him,” whereas Browne translates the Old Nubian with “in order that, as for all you have given him, he may give eternal life to them,” with an inexplicable “as for.” Yet in both translations, ṭⲏⲕ- and πᾶν ὃ δέδωκας αὐτῷ δώσῃ are appositions to ṭⲏⲕ- and αὐτοῖς.

54 Satzinger, “Relativsatz und Thematisierung im Altnubischen,” p. 189
respectively. Also note that the plural object marker -˵ⲟ in  التنفيذي refers to the antecedent ิน魉魇.

5.7 Quantifier raising
Satzinger points out that it is “remarkable” that the construction with -甸 as discussed in §5.3 often appears in the context of the quantifiers 甸 and 甸 “everyone.” This fact, however, seems to support our initial intuition that a constituent marked by predicative and -甸 has moved out of its original position to a higher position (cf. §5.4). This type of movement in the scope of quantifiers in commonly referred to as “quantifier raising,” a result of the interaction between semantics and syntax levels of representation. I repeat here the examples given by Satzinger, which are otherwise grammatically akin to the examples adduced in the previous sections.

\[
\begin{align*}
\text{K. 22.4–9} & \quad \text{RTA 53} \\
\text{Jn. 11:27} & \\
\text{P. QI 4.12–13} & \quad \text{RTA 54} \\
\end{align*}
\]

\[
\begin{align*}
\text{72} & \\
& \quad \text{73} \\
& \quad \text{74} \\
\end{align*}
\]

\[
\begin{align*}
\text{“All men who act in God’s name, when grudging(?), will obtain nothing from God”} \\
\text{“And all living beings who believe in me do not die until eternity”} \\
\text{“And everyone who believes in the cross with their entire heart will stand under (it)”}
\end{align*}
\]
In all three examples we find that the constituent including the quantifier has moved to the first position in the clause, leaving behind the rc. Note that we have observed in §5.5 that in a neutral environment rc's always precede a quantifier. In exx. 72–4, however, we find that they all have moved and have been marked by the predicative marker -ⲥⲛ̄ and the emphatic marker -ⲥⲛ̄.

Whereas exx. 72–4 all showed subjects containing a quantifier, the following examples all feature an object containing a quantifier. In each case the quantifier has moved up to the left edge of the constituent.

Note here the presence of both an overt subject ⲗⲉⲓⳝⲥⲁⲛⲅⲟⲩⲛⲕⲁ and agreement morphology in the embedded verb ⲉⲉⲓⳝⲥⲁⲛ (cf. ex. 69), and also observe the curious presence of the nu before the accusative -ⲥⲛ̄, which unfortunately remains unexplained.

Oh Peter, my friend, and you, my brothers, you know all the things that the unjust Jews did to me

And also protect everyone who hopes in his cross
I would like to emphasize again that in all above examples of cīn-topicalization, the topicalized antecedent cannot move out of its constituent, but only moves to its leftmost position, as in above example. This only makes sense under the assumption of head raising movement, a possible interpretative framework for Old Nubian rcs that I have referred to earlier. This becomes clear when we contrast exx. 72–7 with an example in which the constituent that is topicalized by cīn is not the antecedent of an attributive rc.

Superficially, this example is similar to ex. 61, functioning as a sort of captioning to the text that follows, in this case a sermon on the four creatures. There are however, notable differences. First of all, it features the suffix -ɕi, which we are by now acquainted with. Furthermore, it seems that the verb has moved out of its original position at the end of the clause. Observe also that the verb has person morphology, while the subject of the clause τάλλα [...] εἰς ἐνοχὴν is simply marked with a determiner, as we would expect in a regular sentence. So it seems that we are not dealing with an extraction of an antecedent from an rc, as is suggested by Satzinger, but rather with a different kind of inversion, based on a regular sov sentence; the translation with a passive in English therefore only imitates the word order, but not the morphology. What we are dealing with is...
Old Nubian Relative Clauses

Old Nubian Relative Clauses

\[ \text{ⲱ̄ⲣ<ⲉ>ⲥⲉⲛ ⲥⲁⲗ} \]

- starting out as an object of \( \text{ⲡⲉⲥⲓⲛⲁ} \), within the usual sov order of an Old Nubian sentence, but which is subsequently topicalized with the predicative and \(-\text{ⲡⲉⲥ} \text{ⲓⲛ} \), moving to the leftmost position in the sentence. What the head raising analysis of \( \text{rc} \) predicts, is that this type of long-distance movement would be impossible for antecedents in an \( \text{rc} \). This seems to be confirmed by exx. 72–7.

6 Extraposition

Old Nubian is an sov language, meaning that modifiers in general precede heads. We have already seen that most attributive \( \text{rcs} \), except for certain non-coreferential attributive \( \text{rcs} \) (§3.3.1), \( \text{rcs} \) of time, place, and manner (§3.3.2), and \( \text{rcs} \) in the scope of quantifiers (§5.6), do not follow this pattern. This situation can be accounted for through the head raising analysis of \( \text{rcs} \), an analysis that is empirically supported by the existence of anaphors (§3.4), and the constraints on \( \text{ⲉⲛ̄ⲣ} \)-topicalization and quantifier raising (§5.7). However, in some cases we find that material is transported to the right edge of the clause, usually in a position following the main verb of the sentence. We speak of extraposition when a constituent is partially or fully moved to the right edge of the main clause, therefore appearing after the main verb in its original position. Extraposition regularly happens in case of “heavy” constituents, such as coordinated noun phrases, as can be noticed from the following examples. Extraposition only seems to appear in the case of non-coreferential \( \text{rcs} \).

\[ \begin{align*}
\text{eιηνον} & \text{ ειηνα} \ 
\text{ⲡφνδε} \text{ ελλεν} \ 
\text{κεταλλεν} \ 
\text{eιρου} \ 
\text{ταλου} \ 
\text{τιδιν} \ 
\text{αιρουτκα} \ 
\text{ειδρι’} \ 
\text{ον} \\
\text{ειττουο νιςους} \text{ χριστοικα} \ \\
\text{ein-mon} & \text{ ein-na} \ 
\text{αινι} \text{ ellen} \text{ ketallen} \\
\text{dem.prox-c} & \text{ be-prs.2/3sg} \text{ life eternal} \\
[ & \text{eir-ou} \ 
\text{till-ou} \ 
\text{tijn-i} \ 
\text{aaurout}-ka] \text{ ṭι} \ 
\text{eiar-i} \\
\text{2sg-j} & \text{ God-j} \ 
\text{true-j} \ 
\text{alone-acc} \ 
\text{know-pred?} \\
[ & \text{on} \ 
\text{[rel eit-iss]-ou} \ 
\text{iēsous-i} \ 
\text{khristos]-ika} \\
\text{c} & \text{ send-PT2-j} \ 
\text{Jesus-j} \ 
\text{Christ-acc} \\
\text{“And this is the eternal life: to know you, the only true God and Jesus Christ whom you sent” (Jn. 17:3)} \end{align*} \]

The extraposition of the second part of the coordinated noun phrase that is the object of \( \text{eιαρι} \) is straightforward, as it is moved to the right edge of the main clause. The extraposed clause \( \text{ειττουο νιςους} \text{ χριστοικα} \) itself contains a \( \text{rc} \) without, however, an explicit subject, as

56 Verbs marked by \(-\text{ⲁⲧω} \) or with affirmative or imperative case marking often move to a position higher up in the sentence. See also the commentary to ex. 80.
we would expect. Perhaps the fact that the subject is very obvious (i.e., God), allows for it to remain implicit. The interpretation of the verb ⲉⲓⲣⲓ is less straightforward. Browne rightly indicates a parallel, if fragmentary, passage in L. 106.18, where again we find ⲉⲓⲣⲓ \ on 6[1]. Scribal error therefore seems to be unlikely. The parallel Textus Receptus of Jn. 17:3 has the regular active form γινώσκωσιν. Considering the fact that the entire phrase ⲉⲓϩⲩ ⲛⲕⲣⲓⲧⲓⲟⲕⲁ is an apposition to the predicate Ⲝⲟⲩ ⲛⲕⲧⲛⲨⲧⲕⲓ, the expected morpheme would be a predicative -Ⲕ. Perhaps we are dealing here with a weakening of -Ⲕ > -ⲓ. This intuition seems to be supported by ex. 38, in which we find ⲉⲓⲣⲓ Ⲝⲟⲩⲓⲧⲅⲥⲕⲭⲕⲓⲡ, again with an iota instead of an alpha.

Browne translates this sentence with “The Lord will say in the writing: ‘The people and the rulers of these who are born here.’” The issue with this translation is that it fails to account for the genitives on both Ⲝⲟⲩⲓⲧⲅⲥⲕⲭⲕⲓ and the auxiliary verb ⲛⲕⲧⲛⲨⲧⲕⲓ depending on ⲛⲧⲓⲣⲓⲧⲅⲟⲩⲓⲧⲅⲥⲕⲭⲕⲓ, with the heavy noun phrase Ⲝⲟⲩⲓⲧⲅⲥⲕⲭⲕⲓ extraposed to the right edge of the sentence. The actual translation is therefore much closer to the Greek of Ps. 86:6 ἐν γραφῇ λαῶν καὶ ἀρχόντων… than Browne’s rendering suggests. The question however remains why the Old Nubian here uses the auxiliary verb ⲛⲧⲛⲨⲧⲕⲓ. Perhaps this again has to do with the weight of the noun phrase “of the people and the princes who are born there.” Note also that unlike the previous ex. 79, the conjunction ⲛⲟⲛ is left behind in the first part of the coordinated noun phrase. Note also that the verb Ⲝⲟⲩⲓⲧⲅⲥⲕⲭⲓ has moved leftward, as can be also seen in other examples, such as exx. 32, 41, 77, 87. This leftward verb movement is supposedly related to the presence of the affirmative suffix -ⲓⲧⲓ.\footnote{Browne, Old Nubian Grammar, §3.9.10.}

This type of extraposition appears to happen with certain rcs, where the entirety of the attributive rc is extraposed to the right edge of the main clause, that is, after the main verb. There seems to
be a difference between extraposition of Rcs that contain an overt subject and those who do not. Whereas the former do not repeat the case marking of their antecedent on the right edge, the latter do. It remains unclear, however, why this difference exists.

6.1 Relative clauses without overt subject/with agreement

In this example, the long Rc with the incomplete subject "tabernacle" as its antecedent is extraposed and placed after the main verb with an emended emphatic suffix -GN. The Rc itself includes both a subject in the genitive case and verb with person marking. The noun contains a double genitive case marking both before and after the conjunctive suffix -DEKEN "and" (with regressive assimilation) with the plural -GOYL written on top of it, which I have tentatively inserted before -DEKEN, although we cannot be certain whether this is the correct position. In this and other examples in which the extraposed Rc contains a verb with person marking, case marking is not repeated.

The entire clause ending in is dependent on from the previous page is a case of quantifier raising (§5.7). The verb form, from "to bless, praise" is supposedly marked by the predicative, with the common -1 + ~ > 6. The RC with a repeated verb, is extraposed from the noun phrase and, and is, as in the previous example, not additionally marked for the accusative case.

Cf. ibid., §3.9.6.1b.
So that they may have a shield that will save and has been strong armor.

We see in this example a construction that is essentially similar to the previous one, save for the clause on ვერ თუifications ერთმანეთში, which is extraposed completely to the right edge of the sentence, after the main verb კონარს in a construction that is similar to Ex 80. Note that although თუifications, with a diaeresis on the iota indicating a new syllable, is indexed as separate hapax adjective, it definitely looks like the verb თუifications with a preterite 2 suffix. In any case, the placement of a possible adjective თუifications after predicative-marked ვერ is curious, and something like *gouea toullisa would be expected. Perhaps a predicative suffix has been lost here before ერთმანეთში, cf. ლარს ერთმა, whose suffix -en I cannot explain. ლარ and possibly თუifications are complex verbal predicates as discussed in §5.2.

### 6.2 Relative clauses with overt subject/without agreement

In contrast with the examples from §6.1, in case the verb in the extraposed RC is not explicitly marked for person, it carries the same case marking as its antecedent. Just like regular RCs, these extraposed RCs may feature a relative pronoun. As yet it is unclear why an overt subject and/or the absence of agreement marking triggers the repetition of the case marking on the extraposed RC. Perhaps we are in these cases not dealing with extraposition proper as in §6.1, but rather with a full clause adjoined to the right edge of the main clause, in which the case marking signals which constituent the RC is coindexed with.

“Father, don’t you remember what a woman gave us?”

The extraposed RC ერთმა ვერ ოდი ექსკლუსიურ ერთმა ვერ ოდი ექსკლუსიურ ერთმა ვერ ოდი ექსკლუსიურ ერთმა ვერ ოდი ექსკლუსიურ ერთმა ვერ ოდი ექს克莱 უსი, moved to the right edge of the verb ლარში, is marked with the accusative case, just

59 Browne, Old Nubian Dictionary, p. 163.
Old Nubian Relative Clauses

like its antecedent in the main sentence ᐜⲥⲧⲉⲩⲉⲙ̄ⲙⲉ. The following two examples both show a relative pronoun:

\[
\text{ⲙⲁⲛ ⲕⲟⲩⲙⲡⲟⲩⲕⲁ ⲫⲇⲁⲗⲉⲛ· ⲏⲛ⳿ ⲧⲁⲛ⳿ ⲟⲩⲥⲕⲣⲁ ⲁ̄ⲅⲟⲣⲥ̄ⲥⲕⲁ}
\]

place.TR-PRED forget-PT2-ACC

“When he saw that egg that he had put away and forgotten”

The extraposed RC ᐜⲥⲧⲉⲩⲉⲙ̄ⲙⲉ Ⲅⲟⲩⲕⲛⲟⲓ ⲕⲡⲟⲡⲓ ⲩⲩⲣⲟⲩⲧⲕⲁ ⲧⲟⳟⲧⲁⲛⲁⲥⲱ· ⲉⲛ̄ ⲉⲗⲉ ⲉ̄ⲗⲏ ⲟⲩ ⲩⲥⲕⲣⲁ ⧱ⳝⳝⲁⲣⲣⲓⲕⲁ

“Make yourselves worthy(?) of the pearl itself, that some day I will place before you”

The pattern of this example follows the previous one, with an extraposed RC on the right side of ⲉⲩⲕⲟⲛⲟⲓ ⲡⲡⲟⲡⲓ ⲡⲟⲩⲣⲟⲩⲧⲕⲁ, marked with an accusative case, just like the object of the main verb.

Sometimes the antecedent is extraposed together with the RC:

\[
\text{ⲁⲓ ⲧⲁ ⲡⲥ̄ⲧⲉⲩⲉⲙ̄ⲙⲉ ⲉⲓⲣ ⲉⲛⲉⲛⲕⲁ· ⲭⲣⲓⲥⲧⲟⲥⲓ ⲕⲟⲥⲙⲟⲥⲗⲁ̄ ⲕⲣⲟⲗ·}
\]

place.TR-PRED Christ-dat come-PT1-DET

“I believe that you are the Christ who came to the world” (Jn. 11:27)
behaved attributive RC, is extraposed in its entirety to the right edge of the main clause. According to Browne, the clitic ta should be interpreted as an “intensifying prefix.” Its status, however, is uncertain.

Bechhaus-Gerst notes that similar constructions exist in Nobiin, where the antecedent is carried together with the RC to the right edge of the main verb. She gives two examples:

88a gelb-on [ideen [rel aaw-o]]-ka tiiraa
HN, p. 212 Nobii
look.around-PST.3SG woman do-PST.PTCP-ACC to
“and he looked around to the woman who had done this”

88b kuñir-oos-on [turba [rel mulee-l finda-fi-i]]
HN, p. 212 Nobii
bury-COMP-PST.3SG tomb hill-in quarry.out-STAT-PTCP
wee]-laa
one-in
“he buries him in a tomb which had been hewn out in the rock”

A final example recapitulates the antecedent in the RC through a personal pronoun, combining extraposition with an anaphor:

84 ἐλλαροι καδακα εἰς λίγα: ἐξ ταλαυ έγογγά [ο]γένης ταλαω ακινδείκα
ed-d-rō kaj-ka [rel ein [dig]]-el
find-FUT-PRS.2PL colt-ACC REL bound-DET
[rel eil tad-ou [ei-gou-la ouen-na tad-dō ak-imis-s]-ika
now 3SG-J man-PL-DAT one-GEN 3SG-upon sit-NEG-PT2-ACC
“You will find a colt that is bound, one upon which no one among
men has yet sat” (Mk. 11:2)

The entire extraposed clause ἐξ ταλαυ έγογγά [ο]γένης ταλαω ακινδείκα is marked with the accusative case, just like the object of ἐλλαροι, καδακα. The border between an extraposed RC and an right-adjoined clause is vague here, because grammatically speaking the antecedent of έγογγά [ο]γένης ταλαω ακινδείκα is not καδακα, but ταλαυ. We should however note the other attributive RC in this example, καδακα εἰς λίγα, which is exceptional both because of the case marking on καδακα instead of on the RC and the presence of a relative pronoun εἰς, which is unusual in coreferential clauses; we would expect either something like *kajou digika or *digel kajka. It may be posited provisionally that the curious placement of the accusative case and the appearance of the complementizer are related, but for the moment I am unable venture a syntactical explanation.

60 Browne, Old Nubian Dictionary, p. 167.
61 Bechhaus-Gerst, The (Hi)story of Nobii, p. 212.
7 Preterite tense morphology

In his *Old Nubian Grammar*, Browne suggests that the distinction between the preterite 1 and preterite 2 forms of the verb is to be found in the broad realm of aspectual difference. However, he makes a cursory remark that the preterite 2 forms are always found when the subject is marked with the genitive case, and that in other cases the preterite 1 form is used.\(^{63}\) We recall here that a genitive subject only appears in non-coreferential attributive clauses. Therefore we could tentatively reformulate Browne’s casual observation more rigorously: In order to express the past tense, preterite 1 suffixes are used within coreferential attributive clauses, whereas preterite 2 suffixes are used within non-coreferential attributive clauses.

Please consider the following typical examples:

\[\begin{align*}
\text{Is-lo pi-na} & \quad \text{[ioudaios-gou-n ourou-ou]}
\text{inter-LOC exist-PRS.2/3SG Jew-PL-GEN king-J} \\
\text{bear-PASS-PT1-DET}
\end{align*}\]

“Where is the born king of the Jews?” (coreferential)

\[\begin{align*}
\text{koumpou ein tan-na kip-s} & \quad \text{[ounn-outak-o]-l}
\text{REL 3SG-GEN eat-PT2-DET}
\text{doumal doutrap aŋ-r-aŋ-a suddenly fowl live-TR-INCH-PRED}
\end{align*}\]

“The egg that he had eaten suddenly coming to life as a fowl” (non-coreferential)

The first example shows a coreferential attributive clause with a preterite 1 suffix -\(o\), whereas the second example features a non-coreferential attributive clause with a preterite 2 suffix -\(s\). This distinction holds for all previously cited examples.

The morphological distinction between these two classes of attributive RCs with preterite/past tense morphology may still be found, albeit sometimes morphologically or phonologically reduced (and glossed differently), in Nobiin:

\(^{62}\) **BROWNE, Old Nubian Grammar, §3.9.7a.**
Van Gerven Oei

91a man buru [rel ik-ka doll-o] ii
dem.dist girl 2sg-acc love-comp4 nom
tan-juti-li
3sg.poss-niece-cop2.prs.3sg
“The girl who loved you is his niece” (coreferential)

91b man buru [rel ir-iin doll-siin] ii
dem.dist girl 2sg-gen love-comp2 nom
tan-juti-li
3sg.poss-niece-cop2.prs.3sg
“The girl whom you loved is his niece” (non-coreferential)

And in Kenzi:

92a tod [rel een-gí jom-e]-l nog-s-u
boy woman-acc hit-pst-rel go-pst-3sg
“The boy that hit the woman left” (coreferential)

92b tod [rel een jom-sí]-n nog-s-u
boy woman hit-pst.3sg-rel go-pst-3sg
“The boy that the woman hit left” (non-coreferential)

This morphological distinction between preterite verb morphology in coreferential and non-coreferential rcs is absent in Andaandi, although Jakobi and El-Guzuulii point out that the innovative preterite 1 suffix -ko is always substituted by preterite 2 suffix -s.

93a ar in kaa=gi goñ-kor-u
1pl dem.prox house=acc build-pt1-1pl
“We have built this house”

93b in tannan kaa [rel ar goñ-s-u]
dem.prox cop house 1pl build-pt2-1pl
“This is the house we have built”

8 Conclusions

In this article I have given an overview of Old Nubian rcs based on a thorough investigation of the examples and explanations in extant scholarly literature, complemented with new material, both from Old Nubian and modern Nile Nubian languages. As I have shown, comparative evidence from modern languages is at several instances of invaluable assistance for formulating the right analyses for Old Nubian grammar.
Old Nubian Relative Clauses

Based on our observations as regards Old Nubian RCs, we could summarize our findings as follows, split along the three types originally described by Satzinger as “A,” “B1,” and “B2.”

<table>
<thead>
<tr>
<th>Relative pronoun</th>
<th>Coreferential RC (“A”)</th>
<th>Non-coreferential RC with overt subject/without agreement (“B1”)</th>
<th>Non-coreferential RC without overt subject/with agreement (“B2”)</th>
</tr>
