ABSTRACT

Bangladesh is predominantly an agricultural country. Agriculture is the indispensable culture of Bangladesh. Agriculture has an enceinte contribution to the Gross Domestic Product (GDP) of the country. Earlier more than 50% of GDP came from this sector. Various types of crops are produced in this country. These crops can be categorized into two; food crops and cash crops. Potato is one of the food-stuff of the most people of the world as well as Bangladesh. Potato crop is being treated as foremost crop. This research was conducted to find out the problems that the farmers face in cultivation and to study the trend of production of potato and relationship between production and export of potato of Bangladesh. The study also aims to show the estimates of potato per division in Bangladesh and thus to help in showing its prospects. This research is quantitative in nature. Data collected from both primary and secondary data sources. Primary data collected from 50 farmers using convenience sampling technique with a set of questionnaires designed for this study. Secondary data is obtained from secondary data sources, Department of Agricultural Extension (DAE) and BBS (Bangladesh Bureau of Statistics). After collecting the data, they were transcribed, tabulated and analysed in terms of the research objectives.

Keywords: Potato, Cultivation, Bangladesh

INTRODUCTION

Cultivated plant Potato, edible tuber of the cultivated plant Solanumtuberum of the family Solanaceae. It was the major crop for the original Americans. It is now one of the staple foods in Bangladesh. Bangladesh is mainly an agro-based country. It is a thickly populated small country with an area of 14.48 million ha. According to an estimate by Bhuiyan et al., 2002, net cultivable land would decrease from 8.42 million ha in 2000 to 7.89 million ha in 2025 and population would increase from 127.22 million in 2000 to 168.96 million in 2025. The per capita net cultivable land would reduce from 0.066 ha in 2000 to 0.047 ha in 2025 (Bhuiyan et al., 2002). The population has doubled in the last 30 years despite a decline in the annual population growth rate from 2.26 in 1961 to 1.47 in 2004. Potato is a staple food in the developed countries and which accounts for 37% of the total production in the world (FAO and CIP, 1995). Considering the trend of population growth and consequently the increased demand for food in the country and dwindling cultivable land area, the potato is likely to play a vital role in the future. Potato is a popular and important vegetable in Bangladesh. For the whole year, it is used as the main vegetable. Potato production in Bangladesh in the fiscal year (FY) 2012-2013, hit a new record of 8.603 million tonnes surpassing the record of 8.38 million tonnes in FY’11. The production witnessed a negative growth in FY’12 when it plunged to 8.205 million tonnes a 2.08 percent fall compared to that of FY’11. The Government statistics provider, Bangladesh Bureau of Statistics (BBS) in its latest release, said potato, the most consumed vegetable item of the country was cultivated on .444 million hectares of land in FY’13. The acreage had increased by 14,000 hectares compared to that of FY’12 which also helped achieve a higher output. Potato was produced on 4.6 million hectares in FY’11. Bidhan Baral, deputy director at BBS told the FE that per hectare yield has been increasing gradually in the country which is very positive for the production scenario. On the other hand, potato export saw a quantum leap in the recently concluded fiscal year, buoyed by higher shipments of Russia amid a tight supply from Pakistan and India to the global market. In Bangladesh, exports crossed the one-lakh-tonnes mark for the first time in the fiscal 2013-14, rising threefold from only 28,416 tonnes in the previous year, according to the Department of Agricultural Extension (DAE). Earning also trebled to $33.82 million in 2013-2014 compared to the previous year, Export Promotion Bureau data shows. This is a milestone. We want to perform better in the days to come. Potato is one of the main commercial crops grown all over the country. In Bangladesh, potato is mainly consumed as a vegetable. Various other food items (Singara, Samucha, Chop, chips etc.) are also made from potato. Adequate supply of potato stabilizes the vegetable market all round the year (Moazzem and Fujita, 2004). Recently, the government has been trying to diversify food habits and encourage potato consumption to reduce pressure on rice. So, potato is becoming an important food for food security in Bangladesh.
LITERATURE REVIEW

A number of studies to agronomic, economic and physiological aspects of potato cultivation have so far been conducted in Bangladesh. This study focused on the problems and possible recommendations in potato cultivation and also showed the relationship between production and export of potato of Bangladesh. Sabur (1988) conducted a study on marketed surplus of potatoes in two districts of Bangladesh, he found that production and marketed surplus of potatoes moved in some positive direction. He observed that the average production cost per hectare was TK. 29635.57 and net return was TK. 30947.82. Das (1992) conducted a study on the profitability of potato cultivation and found that the average yield of potato was 4720 kg per hectare and the average gross return amounted to TK. 33040 per hectare. Et, al. (2001) conducted a survey on potato production in some selected areas of Bangladesh. This study showed that potato production is highly profitable, and it can provide cash money to farmers. In terms of profitability, potato production was more attractive than any other winter vegetables. Per unit yield and gross return of potato were found higher than other competitive crops. According to Noor-e-Alam Siddique, potato has greater scope and potential for food security and poverty alleviation in Bangladesh.

OBJECTIVES OF THE STUDY

Potato plays a vital role to meet the demand of food in Bangladesh and the climate of Bangladesh is favorable for the cultivation of potato. If we increase its production and exportation and ensure its proper utilization it can contribute a lot in the economy of Bangladesh. The objectives of this study are:

- Identify problems and suggest probable solutions for expansion of potato cultivation.
- To find out the prospects of potato cultivation in Bangladesh.
- To find out the trend of the production and export of potato in Bangladesh.
- Identify the relationship between production and export of potato of Bangladesh.
- To find out the reasons for rising the exportation of potatoes.

METHODOLOGY

Both primary and secondary data were used in this study. Primary data was collected from 50 farmers using convenience sampling technique with a set of questionnaires designed for this study. Secondary data was collected from secondary data sources, Department of Agricultural Extension (DAE) and BBS (Bangladesh Bureau of Statistics) etc. will be used for the research. Following statistical analysis will be conducted with the help of statistical applications, such as, SPSS and MS Excel:

- Frequency curve
- Bar Diagram
- Pie Diagram
- Correlation analysis
- Regression analysis

LIMITATION OF THE STUDY

- The primary data has been collected by convenience sampling for convenience. So we might not get the necessary information.
- Due to the shortage of time the study could not cover wide side areas for collecting necessary information.
- Respondents had no written document. Therefore, the researcher had to depend solely on the memory of the respondents.

Problems in potato cultivation

From our primary data, we got the following problems in cultivation of potatoes:

- Unavailability of good quality seed
- Lack of adequate funds
- Unavailability of quality fertilizers in time
- Disease infection
- Labor crisis
- Lack of cold storage facilities
- Low prices at peak harvest period
- High cold storage charge
- No purchase by the government

DATA ANALYSIS, FINDINGS AND DISCUSSION

Trend of production of potatoes in Bangladesh

Table 1: Production of potato, 2008-2009 to 2012-2013

<table>
<thead>
<tr>
<th>Year</th>
<th>2008-2009</th>
<th>2009-2010</th>
<th>2010-2011</th>
<th>2011-2012</th>
<th>2012-2013</th>
</tr>
</thead>
<tbody>
<tr>
<td>Production (in thousand tons)</td>
<td>5268</td>
<td>7930</td>
<td>8326</td>
<td>8205</td>
<td>8603</td>
</tr>
</tbody>
</table>

Source: Statistical Year Book of Bangladesh (2013)

Table 1 shows the production of potato (in thousand tons) in Bangladesh from 2008-2009 to 2012-2013. From the above data, we get the following frequency curve which clearly shows us that production of potato in Bangladesh is increasing rapidly which is very positive for the production scenario.

![Production in thousand tons from 2008-2009 to 2012-2013](image)
Table 2: Annual potato exports, 2007-2008 to 2013-2014

|---------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|

Source: Plant Protection Wing (DAE)

Table 2 shows the high increase in potato exportation in Bangladesh from fiscal year 2007-2008 to 2013-2014.

Reasons behind the increase of exportation of potato

From our secondary data source DAE we got some reasons behind the increase of potato exportation which are given below:

- Low prices in the domestic market were one of the main factors behind the rising exports.
- Currently, exporters get 20 percent cash an incentive which is another factor behind rising exports.
- Potato exports have started rising since fiscal 2009-2010, mainly to cater to the demands of Bangladeshi migrants in Malaysia, Singapore and the Middle East.

Relationship between Production and Export

Relationship between production and export can be shown by the following table:

<table>
<thead>
<tr>
<th>Correlations</th>
<th>Production</th>
<th>Export</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pearson Correlation</td>
<td>1</td>
<td>.770</td>
</tr>
<tr>
<td>Sig. (2-tailed)</td>
<td>.127</td>
<td></td>
</tr>
<tr>
<td>N</td>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>Pearson Correlation</td>
<td>.770</td>
<td>1</td>
</tr>
<tr>
<td>Sig. (2-tailed)</td>
<td>.127</td>
<td></td>
</tr>
<tr>
<td>N</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

Here we found that the coefficient of correlation between production and export is 0.77 which shows that there exits a strong positive correlation between these two variables production and export.

Linear Regression Model

Here to establish a linear regression model we can consider export as our dependent variable which depends on the production of potato. Hence our model is:

\[ Y - \bar{Y} = b(X - \bar{X}) \]

Here b is our regression coefficient.

Model Summary

<table>
<thead>
<tr>
<th>Model</th>
<th>R</th>
<th>R Square</th>
<th>Adjusted R Square</th>
<th>Std. Error of the Estimate</th>
<th>Change Statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>.770</td>
<td>.593</td>
<td>.488</td>
<td>11.300</td>
<td>4.379</td>
</tr>
</tbody>
</table>

a. Predictors: (Constant), production

Here \( R^2 = .593 \) for this model which represents the amount of variance in the criterion variable that is explained by the model. To express this value as a percentage, we multiply this value by 100 (which will tell us the percentage of variation in the criterion variable that can be explained by the model that is 59% variation of Y can be explained by X.

Estimates of potato per division

Table 3: Estimates of potato, 2012-2013 (per division)

<table>
<thead>
<tr>
<th>Division</th>
<th>Chittagong</th>
<th>Sylhet</th>
<th>Dhaka</th>
<th>Barisal</th>
<th>Khulna</th>
<th>Rajshahi</th>
<th>Rangpur</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimates (in. ton)</td>
<td>58491</td>
<td>65766</td>
<td>544198</td>
<td>22529</td>
<td>391287</td>
<td>3126142</td>
<td></td>
</tr>
</tbody>
</table>

Source: Bangladesh Bureau of Statistics

We can graphically represent the above data below:

Fig: Estimation of potato per division (2012-2013)

Table 4: Estimates of potato, 2013-2014 (per division)

<table>
<thead>
<tr>
<th>Division</th>
<th>Chittagong</th>
<th>Sylhet</th>
<th>Dhaka</th>
<th>Barisal</th>
<th>Khulna</th>
<th>Rajshahi</th>
<th>Rangpur</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimates (in M.ton)</td>
<td>656825</td>
<td>49847</td>
<td>5730193</td>
<td>262903</td>
<td>2872645</td>
<td>3221393</td>
<td></td>
</tr>
</tbody>
</table>

Source: Bangladesh Bureau of statistics

Again we can represent the above data by a pie-chart below:

Fig: Estimation of potato per division (2012-2013)
have failed to get back even 30 percent of their investment in the current season, which has created a shocking situation for them. Again cold storage charge is Tk. 4.2-4.5 per kg across the country which is a very high rate, on the other hand nearly 420 cold storages across the country can store 3.6 million tons of potato, which is 44 percent of the total production. Dissemination of market information should be increased so that farmers can get the fair price of the potato. Major problem faced by the potato farmers were lower price of potato during harvesting period, price fluctuation, shortage of capital, high charge of cold storage, lack of good quality seed, perishability of potato, poor storage facility, higher price of inputs and lack of marketing facility etc. Proper steps should be postulated by Government to puzzle out this problem. The determinations of the study will generate basic economic data on the production practices of potato. At long last it will be helpful to the planners and policy makers in contriving micro or macro level policy for the enlargement of potato production in the country. Potato farming is assuming a greater dimension, however bringing pressure on the government to expand its use as alternative food in the domestic sector as well as to explore it for greater export markets in overseas trade.
